Key Features in the Picasa 3.6 Update

- Added support for Collaborative Albums. Now you can upload to a friend's album right from Picasa. You can also invite collaborators to your own albums when you're uploading photos or sharing with friends.
- Added option to share with groups during upload process.
- Added name tag recommendations when viewing albums or folder in the People Panel.
- Improved control over name tags: you can remove certain folders from being scanned for faces by toggling face detection for any folder.
- Added the ability to create and save custom crop sizes.
- Added an option to preserve original JPG compression quality when uploading to Picasa Web Albums. This will take up more online storage space, but upgrade prices are now much more affordable.
- Added option to import photos by date taken, today's date, or a custom folder name. If "date taken" is selected, photos will be automatically organized and saved to separate folders by date.
- After you've tagged some pictures, you can do creative things with your name tags, like finding all the photos with the same two people in them or creating a face collage with just one click.
- Name tags in Picasa use the same technology that has powered name tags in Picasa Web Albums since last fall.
- Integrated Google Maps make adding geotags to your photos even easier.

Improved import room

- Totally re-designed import process allows you to import photos from your camera or memory card, and upload selected photos to Picasa Web Albums in one step.

Improved tags

- Picasa 3.5 has a brand new tags panel.
- 'Quick Tag' functionality allows you to access your most commonly used tags, and tag counts show the number of photos to which a tag has been applied.
