

## SLIDE SHOW MOVIE – I found this tutorial very helpful – Enjoy!!

The newest version of Google's popular Picasa program now has a feature where you can select a folder or album of pictures and create a fully compressed yet high quality slide show movie of the pictures! You can then take the small video and upload it to your Picasa web albums, YouTube, or even your MySpace account to share with family and friends. Here's how you do it:

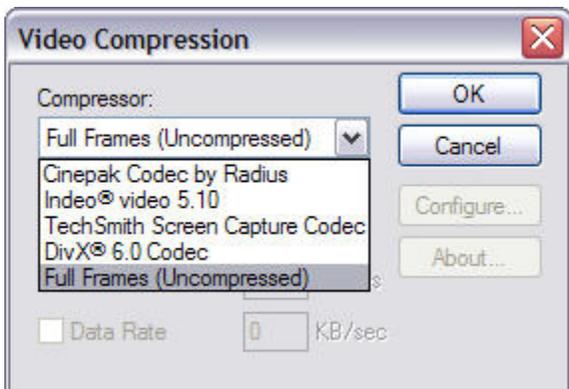

In Picasa, select a folder or album from the right hand pane first. Once you select the folder, go to **Create** from the top menu and choose **Movie**.

On the Create Movie options screen, you can choose the amount of delay you want between pictures. The default 1 second I find to be very fast and you don't really have enough time to see anything! I found 3 seconds to be ideal for me without being too long. However, if you're planning on creating a movie of 300 pictures, 1 second might be just fine or else it might get too long.

also found 320x240 movie size to be too small and grainy. The large size gave a much better picture than small and was not significantly lower in quality than Widescreen. The major difference is in the size of the files depending on whether they are compressed or uncompressed. I created some test movies with various options and I'll give the results out of those below.

On the Video Compression dialog, you will have an option of Full Frames (Uncompressed) or several other compression methods. I chose DivX 6.0 Codec because it gave me extremely small files or high quality on my tests. Click OK and Picasa will create your movie and open the folder where the movie was saved to.

Here are the results of creating a movie from 10 pictures taken by a Sony DSC-N2 8MP [digital camera](#), with 3 second delay between pictures and DivX compression:

Small: Uncompressed: **220 MB**, Compressed: **3.04 MB**

Large: Uncompressed: **883 MB**, Compressed: **3.13 MB**

Widescreen: Uncompressed: **1.94 GB**, Compressed: N/A

As you can see from the [table](#), you'll definitely need to compress if you want to be able to share these movies with anyone! But the DivX compression was very impressive bringing the [file size](#) down from 883 MB to 3.13 MB! And there wasn't very much difference between the compressed files for small and large. I wasn't able to get the program to create a file for me for Widescreen compressed because of an error, but once I get that I'll update the post.

Once you have your file, you can go to Picasa and right click the video and choose Upload to Web Album. If you use YouTube, you can post your video there and share it. Or if you use MySpace, you can create the video and then post the video by clicking on Videos under your picture:

And then click the Upload tab and fill out the form to upload your video!

A screenshot of the "Upload Video" form in a video-sharing application. At the top, there is a navigation bar with tabs: "Videos", "Featured", "Videos", "My Videos", and "Upload". Below the navigation bar, there is a red header "Upload Video" and a red warning message: "Note: If you upload porn or unauthorized copyrighted material will be deleted. Terms and Conditions." Below the warning, there are two input fields: "Title:" with a text box and "Maximum length: 64" below it; and "Description:" with a text area and "Maximum length: 3000. Characters remaining: 3000." below it.

Once uploaded, you can share the link with your friends and family.
